

History, Mission, and Strategies of Native Seeds/SEARCH

and a custom platform for sourcing and sharing
crop-specific information for climate change adaptation

Chris Schmidt
Director of Conservation

cschmidt@native-seeds.org
www.native-seeds.org

- ❖ NGO founded in 1983 in Tucson, USA
- ❖ Conserves, documents and promotes local crop varieties and wild relatives in the Greater Southwest region
- ❖ *In situ*, *ex situ*, and cultural conservation programs
- ❖ Works toward regional food security, sovereignty and resiliency
 - ❖ High rates of food insecurity
 - ❖ High rates of farmland degradation
 - ❖ Pending critical water shortages
 - ❖ Rapidly growing populations
 - ❖ Reliant on fragile supply lines
 - ❖ At the frontlines of climate change

accessibility and adaptation

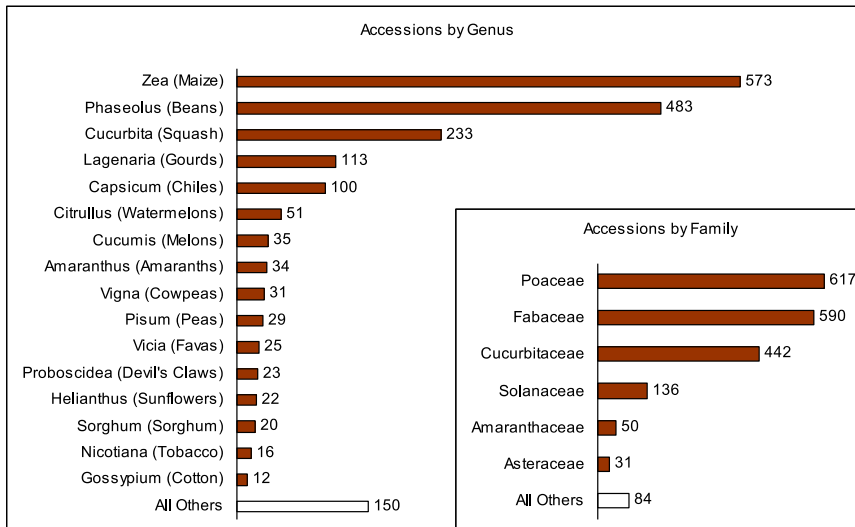

NS/S Seed Bank Collection

- ❖ 1,900 accessions, 100 species
- ❖ Agricultural and ethnobotanical legacies of over 50 indigenous peoples
- ❖ Over past decade have distributed ~25,000 seed packets/year (now ~70,000/year)
 - ❖ 25% returned to indigenous farmers
- ❖ Consists largely of landrace/local varieties
- ❖ Increasing global importance due to climate change
- ❖ Expanding scope to include material from outside region
- ❖ Actively working on IPR/benefits sharing

Native Seeds/SEARCH Collection

Restoration of Heritage Grains in the Borderlands

- ❖ A two-year grant-funded project involving nearly 20 non-profits and businesses in southern Arizona
- ❖ Aimed at market recovery of two of the oldest grains grown in Arizona: White Sonora soft bread wheat and Chapalote flint corn
- ❖ Includes production, research, milling, distribution, marketing, and education

CORN

INFORMATION FORM

Please fill out the following questions for each corn variety that you grow. When applicable, all measurements should be metric. Weight can be in lbs. as it's easily converted to grams or kilos.

CATALOG No./CROP NAME:

Date planted: _____

Date transplanted into garden (if applicable): _____

Date of 1st germination: _____

No. seeds planted: _____

No. seeds germinated (date): _____

Did the crop receive full sun, partial sun, or full shade?

continued

PHOTOGRAPHING CORN

Getting good photographs of plants in the field can be difficult. Mostly what we're looking for with corn is some **sense of the overall plant, the ear and color of the kernels** and any other **interesting features**. At right are several examples to help you best document each variety you grow. If you're growing more than one corn variety, be sure to label each photograph with the catalog name and number. If you're only growing one variety, it's still a good idea, but less critical. A ruler helps give scale to your photograph and is an important feature for NS/S. If possible, be sure to include **something for scale** in each photograph—a yard/meter stick, shovel, person, etc. for whole plants; a ruler, business card, etc. for close-ups.

If you don't have a good meter stick, a person standing near the corn is a good way to "measure" plant height. Be sure to provide us with the person's height!

Photo-documentation of the ears is extremely important for maize—it shows both kernel color but also the general size and shape of the ears, both important in determining which race of maize an accession belongs to.

Crowd-Sourced Data (cont'd)

QUESTION KEY

CORN

Date planted: the date you sowed the seeds, either directly into the ground or in a seedling tray.

Date transplanted into garden: the date you transplanted the seedlings into the garden.

Date of 1st germination: the date you noticed the first seedling emerge (either from the ground or in a seedling tray; if a seedling tray, be sure to let us know how/where you started the plants).

Number of seeds planted/germinated (date): please count the number of seeds you plant before you plant them! When you decide that no more plants are likely to germinate, count the number of seedlings; include the date.

Date of 1st tasseling: the date when you see the first tassel sticking up above the plants.

Date of 1st silking: the date you see the first silks form. These emerge from the shoots that eventually form ears.

Length of time that tassels and silks were produced: Once no more silks are being produced, ears can no longer be pollinated. Tassels are usually produced prior to silks, so look for the last plant producing tassels.

What color were the tassels? Silks? Most tassels and silks are "yellow", but both can be colored. Tassel colors can vary from all yellow (stems and anthers) to yellow anthers with purple stems to purple anthers with purple stems. Please try to indicate both anther and stem colors. Silks are mostly yellow but can also be purple- or pink-tinged.

Were leaves/veins other colors besides green? If so, estimate the number or percentage of plants. Leaves are usually green with green colored venation (the veins). However, other pigments, particularly anthocyanins, may result in purple leaves and/or veins. We have rarely seen an entire plot that is colored, but please indicate if yours is!

Were aerial roots produced? If so, on how many nodes? Aerial roots are produced just above the soil (see photograph) and can help stabilize plants. Please indicate whether you noticed aerial roots, on approximately how many plants in your plot, and the average number of nodes on which they were produced (see photograph).

Did you have any problem with lodging? In windy locations, corn plants may easily lodge (fall over). Some varieties are less susceptible to lodging. Please indicate whether your plants tended to lodge and whether they recovered on their own or not.

How tall is the plant at maturity? Try to measure from the ground to the highest average point of the plants; a metric ruler (cm) is best, but use whatever you have. A photograph with a person of known height works well for this. Be sure to indicate the person's height!

Date of harvest: this may depend on how you harvest cobs. If you've been harvesting green ears to eat roasted as "sweet" corn, let us know when you started/stopped harvesting like this. Otherwise, we're interested in the date when your corn is considered "done".
